Data Management Plan

Final Version

PUCS has received funding from the European Union's Horizon 2020 Research and Innovation Programme under Grant Agreement No. 730004

Deliverable 1.1	Data Management Plan
Related Work Package:	**WP1 – Co-ordination**
Deliverable lead:	**VITO**
Author(s):	**Dirk Lauwaet, Filip Lefebre, Nele Veldeman**
Contact for queries	dirk.lauwaet@vito.be
Grant Agreement Number:	n° 730004
Instrument:	HORIZON 2020
Start date of the project:	01 June 2017
Duration of the project:	30 months
Website:	www.climate-fit.city
Abstract	In this document we describe the data management for the Climate-fit City project. This data management is largely achieved through deposing and referencing the data in a VITO hosted web platform. We distinguish between two broad groups of data: (1) basic urban climate information and (2) sectoral climate information. The basic urban climate data is made fully and openly accessible. The sectoral climate data are deemed less relevant for the general public, but can be accessed or requested through the links and contacts in this document.

Dissemination level of the document

X	PU	Public
	PP	Restricted to other programme participants (including the Commission Services)
	RE	Restricted to a group specified by the consortium (including the European Commission Services)
	CO	Confidential, only for members of the consortium (including the European Commission Services)

1. Data overview

To deliver its urban climate services, the Climate-fit.city project generates and processes climate and sectoral data at the scale of individual cities. Two sorts of data are being generated: (1) **basic urban climate data**, fairly generic and mostly using scientific data formats such as e.g. NetCDF, and (2) **sectoral climate data**, i.e., value added information that builds on the data in (1), and generally in a format that complies with the practice of the end-user (e.g. MS Excel table). The generic urban climate data stem from either the UrbClim model (VITO) or from the statistical downscaling approach (KULeuven). The sectoral climate-related information is generated through the implementation of sectoral case studies. The total amount of raw data produced by the project is in the order of 15 TB. An overview of these data are given in the Tables below.

The generic urban climate data is meant to be useful to so-called climate service purveyors, i.e., organisations that create added value onto the generic climate data by combining them with sectoral information. Therefore, within the framework of the project an **Urban Climate Data web platform** is set up and hosted by VITO, to make the data easily accessible and reusable to any interested parties. More details on this web platform are provided in the next Chapters of this data management plan.

The sectoral climate information is mostly relevant for the end-users that are partners in the project and they can be accessed through the references and links that are provided in this document.

PUCS has received funding from the European Union's Horizon 2020 Research and Innovation Programme under Grant Agreement No. 730004

2. Findable, accessible, Interoperable, reusable (FAIR) data

2.1. Making data findable, including provisions for metadata

The generic urban climate data that are produced in the Climate-fit.city project are made available through the VITO-hosted urban climate data platform (https://dataplatform.climate-fit.city/). The model data are in Netcdf format, where versioning is included in the Netcdf metadata.

2.2. Making data openly accessible

The generic urban climate data (UrbClim model output and climate statistics) are fully and openly available through the urban climate data platform (https://dataplatform.climate-fit.city/). Overview maps are made for all variables, time horizons and emission scenarios for each city (in GIS raster geotiff format), which can directly be downloaded from the platform. Also the climate statistics for each city (in MS Excel format) are directly downloadable. The raw model output data (in Netcdf format) can be retrieved from the platform via FTP protocol.

The sectoral climate information (in varied formats) can be retrieved through the links and contacts in this document.

2.3. Making data interoperable

All data are interoperable, by using standard scientific data formats (Geotiff, Netcdf) and standard commercial data formats (e.g., MS Excel).

2.4. Increase data re-use

The basic urban climate data employ an Open Definition license (opendefinition.org) and can be re-used freely. Sectoral climate data generated in the project may be subject to more restricted licensing and access schemes. Data that serve as a basis for scientific publications will be embargoed until the actual publication is released. The basic urban climate data are deemed the most useable by third parties, including after the end of the project. Some of the sectoral climate data may be less useable by third parties as they are specifically being developed for the end-users that participate in the project, and tailored to their particular needs. In principle, the data will remain re-usable indefinitely, though in practice the expected evolution of the state of the art will make most of the data obsolete after some years.

PUCS has received funding from the European Union's Horizon 2020 Research and Innovation Programme under Grant Agreement No. 730004

3. Allocation of resources

We cover the costs of making the data FAIR and open through the budget of the H2020 project grant. The project co-ordinator (VITO) is the main responsible, and the partners are each responsible for the sectoral data they contribute.

4. Data security

VITO houses 2 data centers on its site in Mol. These data centers consists of rack-mounted hardware and is build according to the cold corridor concept for optimal cooling. Hardware-level security is provided through access control, fire and smoke detection systems containing an automatic fire extinguishing based a non-hazardous gas extinguishing system. In terms of power supply, uninterruptable power supplies (UPS) are foreseen as backup for short term electrical interruptions.

For the Climate-fit.city project a high-performance storage system is in place. Through this system we have the necessary storage capacity available which is very efficient and fail-safe. Fail-safe means that all components within this closed system have been doubled so that if any component fails, an identical component takes over the function. This happens without the global functionality being compromised. This allows these devices to offer a guarantee that they will continue to function and that no data will be lost if certain hardware components fail.

Although our storage system is provided with the necessary security features, all data remains captured within one system. If this system fails due to force majeure, all data could be lost. Therefore a back-up solution is in place for our infrastructure. This backup system is based on different hardware and technology and stores snapshots of the high-performance storage system in a backup schedule (for the current week a snapshot is stored every day, for the current month every week, for the current year every month).

For a third tier, data can be written to LTO tape storage and stored in an enclosed space. This way data can be retained over several years without further maintenance cost.

5. Ethical aspects

There are no ethical or legal issues with all the datasets that are listed in this report, that could hinder data sharing.
